Manufacturing Operational Insights Report

Autonomous Logistics Researcher Agent

Course Name: Agentic AI

Institution Name: Medicaps University – Datagami Skill Based Course

Student Name(s) & Enrollment Number(s):

Sr no	Student Name	Enrolment Number
1.	Vasu Joshi	EN22EL301063
2.	Yash Kag	EN22CS3011103
3.	Yash Parashar	EN22CS3011106
4.	Yashee Verma	EN22CS3011115
5.	Yashraj Singh Sisodiya	EN22CS3011120

Group Name: Group 12D10

Project Number: AAI-25

Industry Mentor Name:

University Mentor Name: Prof. Maya Baniya

Academic Year: 2025-26

1. Problem Statement & Objectives:

1.1 Problem Statement

In today's fast-paced logistics and supply chain industry, decision-making depends heavily on accurate, real-time information. However, collecting such information requires manually browsing multiple websites, filtering irrelevant data, and synthesizing insights, which is time-consuming and inefficient. Moreover, human-based research is prone to inconsistencies and may miss critical insights due to information overload.

There is a growing need for an intelligent, automated system that can independently understand user queries, gather relevant data from diverse sources, and generate concise, reliable summaries. The challenge lies in building a system that is not only accurate but also autonomous, scalable, and capable of continuous learning

1.2 Project Objectives:

- Design and develop an **autonomous AI agent** for logistics research
- Enable **intelligent query understanding** using LLMs
- Automate **web search, scraping, and data extraction**
- Perform **multi-source data aggregation and filtering**
- Generate **context-aware summaries and insights**
- Implement a **knowledge base for storing and reusing information**
- Ensure **scalability, modularity, and extensibility** of the system
- Reduce **manual effort and improve decision-making efficiency**

1.3 Scope of the Project:

- Focuses on **logistics and supply chain research queries**
- Supports **text-based input and output only**
- Utilizes **public web data sources**
- Generates **summarized reports instead of raw data dumps**
- Implements a **basic knowledge base (file/vector-based)**
- Designed for **academic and prototype-level deployment**

Limitations:

- Depends on availability and quality of web data
- May face restrictions due to website scraping policies
- Limited domain knowledge beyond logistics

2. Proposed Solution:

The proposed solution is an Agentic AI-based autonomous research system that combines:

- Large Language Models (LLMs) for reasoning and summarization
- LangChain for workflow orchestration
- CrewAI for multi-agent collaboration

The system operates using multiple specialized agents:

- A Research Agent to collect data
- An Analysis Agent to filter relevant information
- A Summarization Agent to generate insights
- A Storage Agent to persist results

This modular, agent-driven approach ensures flexibility, scalability, and efficient task execution.

2.1 Key Features:

- Fully autonomous research capability
- Multi-agent collaboration for task distribution
- Real-time web data retrieval
- Intelligent summarization using LLMs
- Knowledge base integration (RAG-ready)
- Context-aware and dynamic responses
- Scalable and modular architecture
- Reduced redundancy using caching and storage

2.2 Overall Architecture/Workflow:

The system follows a **pipeline-based architecture**:

1. User Query Input
2. Query Processing (LLM interpretation)
3. Search API Invocation
4. Web Scraping of selected sources
5. Data Filtering and Cleaning
6. Summarization using LLM
7. Knowledge Storage (KB)
8. Final Output Delivery

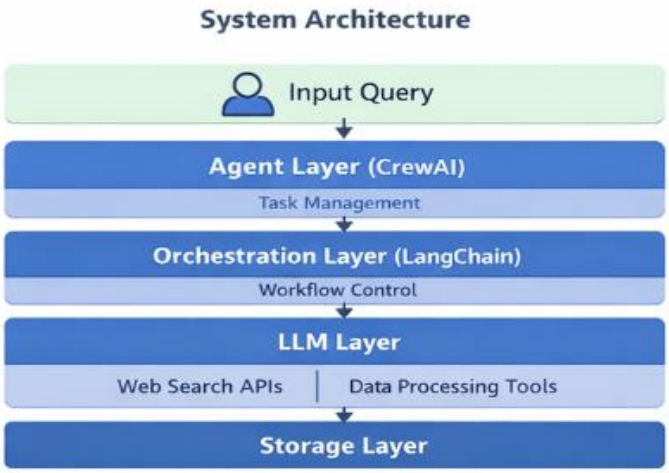

Fig 1: Architecture Diagram

2.3 Tools & Technologies Used:

- **Python:** Core development language
- **LangChain:** Chain-based workflow and tool integration
- **CrewAI:** Multi-agent coordination framework
- **LLM API (Gemini 1.5 flash):** Natural language understanding
- **BeautifulSoup / Selenium:** Web scraping and automation
- **FAISS / Chroma:** Vector database for semantic search
- **.env:** Secure API key management
- **File System / Database:** Storage of results

3. Result & Output:

3.1 Screenshots/Outputs:

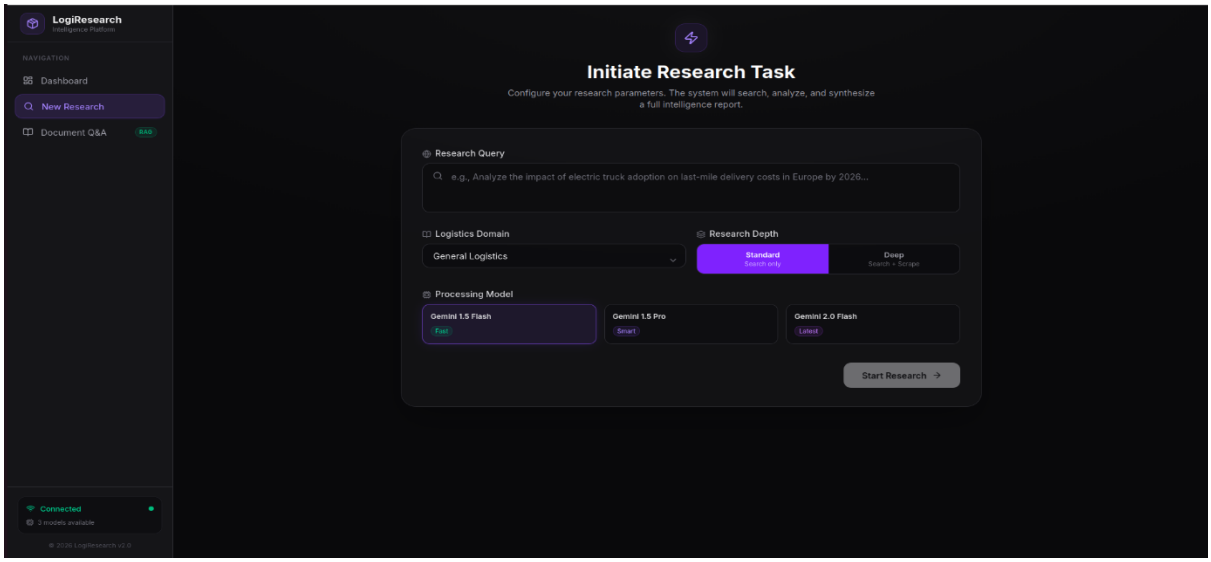

Fig 2: Output

3.2 Reports /Dashboards /Models:

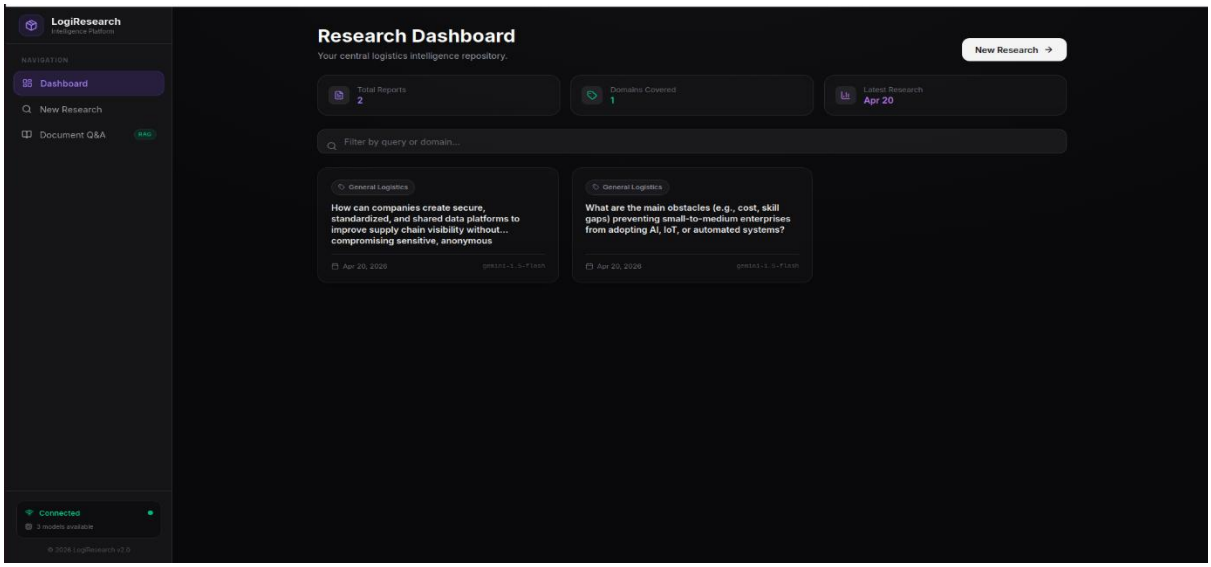

Fig 3: Research Dashboard

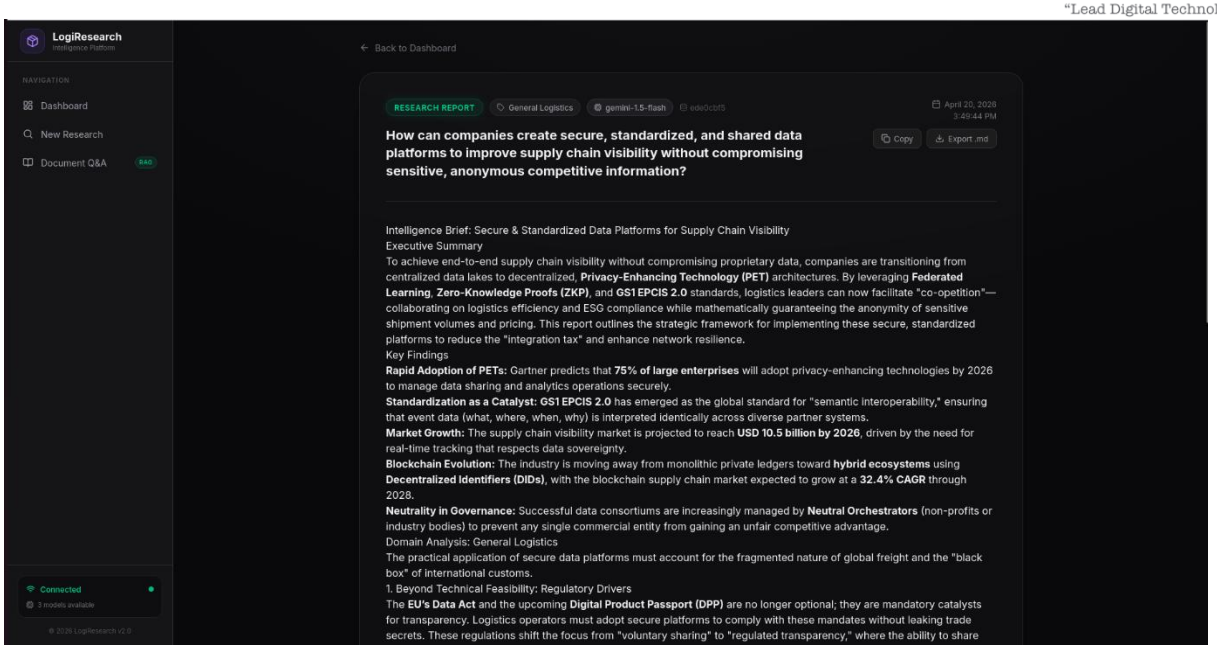

Fig 4: Research Report

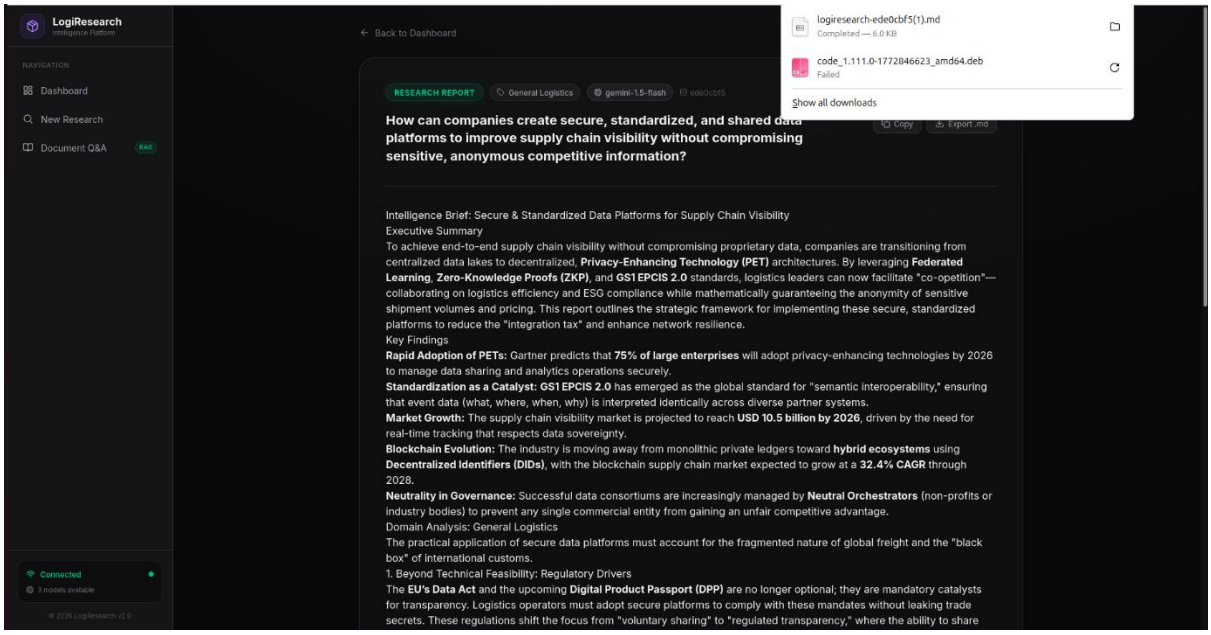

Fig 5: Exporting Report

3.3 Key Outcomes:

- Significant reduction in manual research time
- Improved accuracy through multi-source validation
- Efficient summarization of large datasets
- Demonstration of real-world Agentic AI application
- Foundation for building advanced RAG systems

4. Conclusion:

The *Autonomous Logistics Researcher Agent* demonstrates how Agentic AI can transform traditional research workflows into intelligent, automated processes. By

integrating LLMs with tools like LangChain and CrewAI, the system efficiently gathers, processes, and summarizes logistics-related information.

The project successfully showcases:

- Autonomous decision-making capabilities
- Multi-agent collaboration
- Real-time data processing

Key Learnings:

- Working with LLM APIs and prompt engineering
- Designing multi-agent systems
- Implementing web scraping and data pipelines
- Building scalable and modular AI applications

Overall, the project highlights the growing importance of AI-driven automation in modern industries.

5. Future Scope & Enhancements:

The project can be further improved with:

- Integration with **real-time logistics APIs and enterprise systems**
- Implementation of **advanced RAG architecture**
- Use of **vector databases for semantic retrieval**
- Development of **interactive web or mobile applications**
- Addition of **voice-based AI assistants**
- Incorporation of **machine learning models for predictive analytics**
- Deployment on **cloud platforms (AWS, Azure, GCP)**
- Enhanced **security, authentication, and user management**
- Integration with **BI dashboards for visualization (Power BI, Tableau)**
- Continuous learning system using feedback loops
